# 1 GENERAL INFORMATION

## 1.1 FEATURES

- 96 Digital I/O Lines
- PC/104 16-bit Interface
- Each line can serve as an input or an output
- Readback capability on all output lines
- Programmable polarity event sense on 48 lines
- Compatible with standard I/O racks
- +5 Volt only operation
- Extended temperature range -40°C to +85°C

## 1.2 GENERAL DESCRIPTION

The PCM-UIO96B is a highly versatile PC/104 module providing 96 lines of digital I/O. It is unique in its ability to monitor 48 lines for both rising and falling digital edge transitions, latch them, and then issue an interrupt to the host processor. The application interrupt service routine can quickly determine, through a series of interrupt identification registers, the exact port(s) and bit(s) which have transitioned. The PCM-UIO96B utilizes the WinSystems' WS16C48 ASIC High Density I/O Chip (HDIO). The first 48 lines are capable of fully latched event sensing with the sense polarity being software programmable. Four 50-pin I/O connectors allow for easy mating with industry standard I/O racks.

## **1.3 SPECIFICATIONS**

### **1.3.1 Electrical**

Bus Interface:	PC/104 16-Bit
VCC:	+5V +/-5% @ 24mA typical with no I/O connections
I/O Addressing:	12-bit user jumperable base address. Each board uses 32 consecutive addresses

### **1.3.2 Mechanical**

Dimensions:	3.6" x 3.8"
PC Board:	FR-4 Epoxy glass with 2 signal layers, 2 power planes, screened component legend and plated through holes.
Jumpers:	0.025" square posts on 0.100" centers
Connectors:	50 Pin 0.10" grid RN type IDH-50-LP

### **1.3.3 Environmental**

Operating Temperature:	-40°C to +85°C
Non Condensing Humidity:	5% to 95%

## 2 PCM-UIO96B TECHNICAL REFERENCE

### 2.1 INTRODUCTION

This section of the manual is intended to provide the necessary information regarding configuration and usage of the PCM-UIO96B. WinSystems maintains a Technical Support Group to help answer questions regarding configuration, usage, or programming of the board. For answers to questions not adequately addressed in this manual, contact Technical Support at (817) 274-7553 between 8AM and 5PM Central Time.

### 2.2 I/O ADDRESS SELECTION

The PCM-UIO96B requires 32 consecutive I/O addresses beginning on a 32 byte boundary. The jumper block at J5 allows for user selection of the base address. Address selection is made by placing a jumper on the jumper pair for the address bit if a '0' is desired or leaving the address bit open if a '1' is required for the desired address. U2 is located at the Base Address, U1 is located at the Base Address plus 10 Hex. The illustration below shows the relationship between the address bit and the jumper positions and a sample jumpering for a base address of 200H.

## 2.3 INTERRUPT ROUTING SELECTION

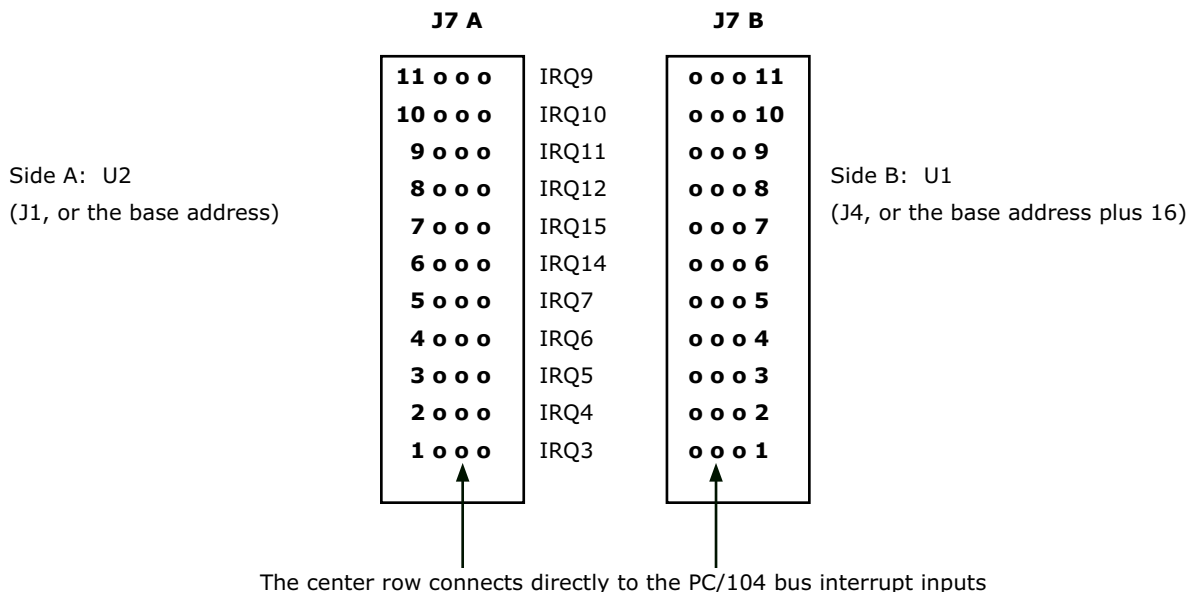

### 2.3.1 Shared Interrupts

For shared interrupts on the PC/104 bus, J6 must be jumpered pins 1-2. For individual interrupts, J6 should remain unjumpered as shown below.

### 2.3.2 Interrupt Selection

When desired, the PCM-UIO96B can generate an interrupt on up to 48 different lines each with its own polarity select. This interrupt can be routed to the PC/104 bus via the jumper at J7. J7 is a three row eleven pin interrupt routing block, side A directs interrupts to connector J1, side B directs interrupts to connector J4, and the center row connects directly to the PC/104 bus interrupt inputs.

## 2.4 I/O CONNECTOR PINOUT

The PCM-UIO96B routes its 96 lines to four 50-pin IDC connectors at J1, J2, J3 and J4. The pin definitions for J1, J2, J3 and J4 are shown here.

## 2.6 WS16C48 REGISTER DEFINITIONS

The PCM-UIO96B uses two of the WinSystems' exclusive ASIC device, the WS16C48. This device provides 96 lines of digital I/O. There are 17 unique registers within each WS16C48. The following table summarizes the registers. The text that follows provides details on each of the internal registers.

I/O Address Offset	Page 0	Page 1	Page 2	Page 3
00H	Port 0 I/O	Port 0 I/O	Port 0 I/O	Port 0 I/O
01H	Port 1 I/O	Port 1 I/O	Port 1 I/O	Port 1 I/O
02H	Port 2 I/O	Port 2 I/O	Port 2 I/O	Port 2 I/O
03H	Port 3 I/O	Port 3 I/O	Port 3 I/O	Port 3 I/O
04H	Port 4 I/O	Port 4 I/O	Port 4 I/O	Port 4 I/O
05H	Port 5 I/O	Port 5 I/O	Port 5 I/O	Port 5 I/O
06H	INT_PENDING	INT_PENDING	INT_PENDING	INT_PENDING
07H	Page/Lock	Page/Lock	Page/Lock	Page/Lock
08H	N/A	POL_0	ENAB_0	INT_ID0
09H	N/A	POL_1	ENAB_1	INT_ID1
0AH	N/A	POL_2	ENAB_2	INT_ID2

### Register Details

**Port 0-5 I/O** - Each I/O bit in each of these 6 ports can be individually programmed for input or output. Writing a '0' to a bit position causes the corresponding output pin to go to a High Impedance state (pulled high by external 10K ohm resistors). This allows it to be used as an input. When used in the input mode, a read reflects the inverted state of the I/O pin, such that a high on the pin will read as a '0' in the register. Writing a '1' to a bit position causes the output pin to sink current (up to 12mA), effectively pulling it low.

**INT\_PENDING** - This read only register reflects the combined state of the INT\_ID0 through INT\_ID2 registers. When any of the lower 3 bits are set, it indicates that an interrupt is pending on the I/O port corresponding to the bit position(s) that are set. Reading this register allows an Interrupt Service Routine to quickly determine if any interrupts are pending and which I/O port has an interrupt pending.

**PAGE/LOCK** – This register serves two purposes. The upper two bits select the register page in use as shown here:

#### D7 D6 Page

```

0 0 Page 0
0 1 Page 1
1 0 Page 2
1 1 Page 3

```

Bits 5-0 allow for locking of the I/O ports. A '1' written to the I/O port position will prohibit further writes to the corresponding I/O port.

**POL0 – POL3** – These registers are accessible when page 1 is selected. They allow interrupt polarity selection on a port-by-port and bit-by-bit basis. Writing a '1' to a bit position selects rising edge detection interrupts while writing a '0' to a bit position selects falling edge detection interrupts.

**ENAB0 – ENAB3** – These registers are accessible when page 2 is selected. They allow for port-by-port and bit-by-bit enabling of the edge detection interrupts. When set to a '1' the edge detection interrupt is enabled for the corresponding port and bit. When cleared to a '0' the bit's edge detection interrupt is disabled. Note that the register can be used to individually clear a pending interrupt by disabling and re-enabling the pending interrupt.

**INT\_ID0 – INT\_ID2**– These registers are accessible when page 3 is selected. They are used to identify currently pending edge interrupts. A bit when read as a '1' indicates that an edge of the polarity programmed into the corresponding polarity register has been recognized. Note that a write to this register (value ignored) clears ALL of the pending interrupts in this register.

## 2.7 CONNECTOR/JUMPER SUMMARY

CONNECTOR/JUMPER	PURPOSE	PAGE REFERENCE
J1	Ports 0-2 I/O Connector	2-3
J2	Ports 3-5 I/O Connector	2-3
J3	Ports 9-11 I/O Connector	2-3
J4	Ports 6-8 I/O Connector	2-3
J5	Base I/O Address select jumper	2-1
J6	Shared interrupt select jumper	2-2
J7	Interrupt routing jumper	2-2
J8	PC/104-8 bus connector	2-4
J9	PC/104-16 bus connector	2-4

## 3 PCM-UIO96B PROGRAMMING REFERENCE

### 3.1 INTRODUCTION

This section provides basic documentation for the included I/O routines. It is intended that the accompanying source code equip the programmer with a basic library of I/O functions for the PCM-UIO96B or can serve as the basis from which application-specific code can be derived.

The sample I/O routines and sample programs were compiled and tested using the Borland C/C++ compiler Version 3.1. The routines should readily port to any compiler supporting basic port I/O instructions.

These routines handle each WS16C48 as a separate "Chip Number". The PCM-UIO96B has two chips 1 and 2.

### 3.2 FUNCTION DEFINITIONS

This section briefly describes each of the functions contained in the driver. When necessary, short examples will be provided to illustrate usage. Any application making use of any of the driver functions should include the header file **UIO48.H**, which includes the function prototypes and the needed constant definitions.

Note that all of the functions utilize the concept of *bit\_number*. The *bit\_number* is a value from 1 to 48 (1 to 24 for interrupt related functions) that correlates to a specific I/O pin. Bit\_number 1 is port 0 bit 0 and continues through to bit\_number 48 at port 5 bit 7.

#### **INIT\_IO - Initializes I/O, set all ports to input**

##### Syntax

```
void init_io(int chip_number, unsigned io_address);
```

##### Description

*This function takes two arguments:*

chip\_number - The chip number 1-4.

io\_address - The I/O address of the WS16C48 chip.

There is no return value. This function initializes all I/O pins for input (sets them high), disables all interrupt settings, and sets the image values.

**READ\_BIT** – Reads an I/O port Bit

Syntax

**int read\_bit(int chip\_number, int bit\_number);**

Description

*This function takes two arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 48 that indicates the I/O pin to read from.

This function returns the state of the I/O pin. A **1** is returned if the I/O pin is low and a **0** is returned if the pin is high.

**WRITE\_BIT** – Writes a **1** or **0** to an I/O Pin

Syntax

**void write\_bit(int chip\_number, int bit\_number, int value);**

Description

*This function takes three arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 48 specifying the I/O pin to be acted upon.

value - is ether 1 or 0.

This function allows for writing of a single bit to either a **0** or a **1** as specified by the second argument. There is no return value and other bits in the I/O port are not affected.

## **SET\_BIT** – Sets the specified I/O Bit Syntax

### Syntax

```
void set_bit(int chip_number, int bit_number);
```

### Description

*This function takes two arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 48 specifying the I/O pin to be set.

This function sets the specified I/O port bit. Note that setting a bit results in the I/O pin actually going low. There is no return value and other bits in the same I/O port are unaffected.

## **CLR\_BIT** – Clears the specified I/O Bit

### Syntax

```
void clr_bit(int chip_number, int bit_number);
```

### Description

*This function takes two arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 48 specifying the I/O pin to clear.

This function clears the specified I/O bit. Note that clearing the I/O bit results in the actual I/O pin going high. This function does not affect any bits other than the one specified.

**ENAB\_INT** – Enables Edge Interrupt, Select Polarity

Syntax

**void enab\_int(int chip\_number, int bit\_number, int polarity);**

Description

*This function takes three arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 24, specifying the appropriate bit.

polarity - specifies rising or falling edge polarity detect. The constraints RISING and FALLING are defined **UIO48.H**.

This function enables the edge detection circuitry for the specified bit at the specified polarity. It does not unmask the interrupt controller, install vectors, or handle interrupts when they occur. There is no return value and only the specified bit is affected.

**DISAB\_INT** – Disables Edge Detect Interrupt Detection

Syntax

**void disab\_int(int bit\_number);**

Description

*This function takes two arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 24 specifying the appropriate bit.

This function shuts down the edge detection interrupts for the specified bit. There is no return value and no harm is done by calling this function for a bit which did not have edge detection interrupts enabled. There is no effect on any other bits.

**CLR\_INT** – Clears the specified pending interrupt

Syntax

**void clr\_int(int chip\_number, int bit\_number);**

Description

*This function takes two arguments:*

chip\_number – The chip number 1-4.

bit\_number – a value from 1 to 24 specifying the bit number to reset the interrupt.

This function clears a pending interrupt on the specified bit. It does this by disabling and reenabling the interrupt. The net result after the call is that the interrupt is no longer pending and is renamed for the next transition of the same polarity. Calling this function on a bit that has not been enabled for interrupts will result in its interrupt being enabled with an undefined polarity. Calling this function with no interrupt pending will have no adverse effect. Only the specified bit is affected.

**GET\_INT** – Retrieves bit number of pending interrupt Syntax

Syntax

**int get\_int(int chip\_number);**

Description

*This function takes one argument:*

chip\_number – The chip number 1-4.

This function returns either a **0** for no bit interrupts pending or a value between 1 and 24 representing a bit number that has a pending edge detect interrupt. The routine returns with the first interrupt found and begins its search at Port 0 Bit 0 proceeding through to Port 2 Bit 7. It is necessary to use either clr\_int() or disab\_int() to avoid returning the same bit continuously. This function may either be used in an application's ISR or can be used in the foreground to poll for bit transitions.

### 3.3 SAMPLE PROGRAMS

There are three sample programs in source code form included on the PCM-UIO96B diskette. These programs are not useful by themselves but are provided to illustrate the usage of the I/O functions provided in UIO96C.

#### FLASH.C

This program was compiled with the Borland C/C++ version 3.1 on the command line with:

```
bcc flash.c uio96.c
```

This program illustrates the most basic usage of the PCM-UIO96B board. It uses three functions from the driver code. The **init\_io()** function is used to initialize the I/O functions and the **set\_bit()** and **clr\_bit()** functions are used to sequence through all 96 bits turning each on and then off in turn.

#### POLL.C

This program was compiled with the Borland C/C++ version 3.1 on the command line with:

```
bcc poll.c uio96.c
```

This program illustrates the additional features of the WS16C48 and the I/O library functions. It programs the first 24 bits for input on each chip, arms them for falling edge detection and then polls the I/O routine **get\_init()** to determine if any transitions have taken place.

#### INT.C

This program was compiled with the Borland C/C++ version 3.1 on the command line with:

```
bcc int.c uio96.c
```

This program is identical in function to the "poll.c" program except that interrupts are active and all updating of the transition counters is accomplished in the background during the interrupt service routine.

#### Summary

The source code for all three sample programs, as well as the I/O routines, are included on the accompanying diskette. The source code is also provided in printed form in Appendix C. These I/O routines along with the sample programs should provide a good basis on which to build an application utilizing the features of the PCM-UIO96B.

# APPENDIX A

## PCM-UIO96B Parts Placement Guide

/*
*
*=====
*                               GET _INT
*
* This function takes one arguments.
*
* chip_number : The desired chip number 1 to 4
*
* return value : The value returned is the highest level bit interrupt
*                 currently pending. Range is 1 to 24.
*
* This function returns the highest level interrupt pending. If no interrupt
* is pending, a zero is returned. This function does NOT clear the interrupt.
*=====*/

## WARRANTY

WinSystems warrants that for a period of two (2) years from the date of shipment any Products and Software purchased or licensed hereunder which have been developed or manufactured by WinSystems shall be free of any material defects and shall perform substantially in accordance with WinSystems' specifications therefore. With respect to any Products or Software purchased or licensed hereunder which have been developed or manufactured by others, WinSystems shall transfer and assign to Customer any warranty of such manufacturer or developer held by WinSystems, provided that the warranty, if any, may be assigned. The sole obligation of WinSystems for any breach of warranty contained herein shall be, at its option, either (i) to repair or replace at its expense any materially defective Products or Software, or (ii) to take back such Products and Software and refund the Customer the purchase price and any license fees paid for the same. Customer shall pay all freight, duty, broker's fees, insurance charges and other fees and charges for the return of any Products or Software to WinSystems under this warranty. WinSystems shall pay freight and insurance charges for any repaired or replaced Products or Software thereafter delivered to Customer within the United States. All fees and costs for shipment outside of the United States shall be paid by Customer. The foregoing warranty shall not apply to any Products or Software which have been subject to abuse, misuse, vandalism, accidents, alteration, neglect, unauthorized repair or improper installations.

**THERE ARE NO WARRANTIES BY WINSYSTEMS EXCEPT AS STATED HEREIN. THERE ARE NO OTHER WARRANTIES EXPRESS OR IMPLIED INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, IN NO EVENT SHALL WINSYSTEMS BE LIABLE FOR CONSEQUENTIAL, INCIDENTAL, OR SPECIAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF DATA, PROFITS OR GOODWILL. WINSYSTEMS' MAXIMUM LIABILITY FOR ANY BREACH OF THIS AGREEMENT OR OTHER CLAIM RELATED TO ANY PRODUCTS, SOFTWARE, OR THE SUBJECT MATTER HEREOF, SHALL NOT EXCEED THE PURCHASE PRICE OR LICENSE FEE PAID BY CUSTOMER TO WINSYSTEMS FOR THE PRODUCTS OR SOFTWARE OR PORTION THEREOF TO WHICH SUCH BREACH OR CLAIM PERTAINS.**

## **WARRANTY SERVICE**

All products returned to WinSystems must be assigned a Return Material Authorization (RMA) number. To obtain this number, please call or FAX WinSystems' factory in Arlington, Texas and provide the following information:

1. Description and quantity of the product(s) to be returned including its serial number.
2. Reason for the return.
3. Invoice number and date of purchase (if available), and original purchase order number.
4. Name, address, telephone and FAX number of the person making the request.
5. Do not debit WinSystems for the repair. WinSystems does not authorize debits.

After the RMA number is issued, please return the products promptly. Make sure the RMA number is visible on the outside of the shipping package.

The customer must send the product freight prepaid and insured. The product must be enclosed in an anti-static bag to protect it from damage caused by static electricity. Each bag must be completely sealed. Packing material must separate each unit returned and placed as a cushion between the unit(s) and the sides and top of the shipping container. WinSystems is not responsible for any damage to the product due to inadequate packaging or static electricity.
